Experience

Perfios (Karza Technologies) Oct 2022 – Present

Senior Software Engineer *Apr 2024 – Present*

- Cut third-party vendor spend 55% by replacing a fixed-order chain of data sources with threshold-based switching that routes around slow or failing ones; with caching and retired infrastructure, this delivered **$700K+** in cumulative savings.
- Brought incidents down from **12–13 a week to 2–3** with trend-based monitoring that automatically deprioritizes failing sources, and cut triage SLA from 3 days to 3–4 hours by introducing triage practices for support engineers.
- Turned fleet-wide changes across **200+** production APIs from full redeploys into one package update by designing and rolling out a shared service framework that replaced duplicated per-API code.
- Built a Redis-backed session library with distributed locks so concurrent Lambda runs share one login instead of racing to re-authenticate, eliminating **35%** of session failures and recovering 15K–30K requests a day.
- Designed and set up active-passive disaster recovery across Mumbai and Hyderabad for a **5M+** requests/day KYC platform at 99.9%+ availability, built for a 40–45 minute switchover of databases, APIs, and gateway routing via GitLab CI/CD.
- Built proxy-routing infrastructure for 120+ APIs that replaced random route selection with health-aware routing and cooldowns, raising first-attempt success from **60–70% to 90–95%**.

Software Engineer I *Oct 2022 – Apr 2024*

- Rebuilt a Lambda-based integration as long-running Celery workers on AWS Fargate with Redis that keep state between jobs, **tripling throughput**; caching and rate limiting then made an external vendor unnecessary.
- Led a stack-by-stack migration of **250+** KYC and utility APIs from Python 3.9 to 3.12, containerizing over 90% for cloud and on-premises deployment with zero production rollbacks.
- Reduced P99 latency from **8s to 3s** on critical legacy client-facing KYC APIs by removing redundant ingestion steps and reworking each API's registry fetch strategy.
- Automated vendor billing with a usage-tracking invoicing service used across products, improving billing accuracy by **25%**.
- Shipped **30+ APIs within six months** and maintained 100+ production APIs spanning 300+ data integrations.

InTimeTec Mar 2021 – Sep 2022

Software Engineer

- Converted a manufacturing client's desktop-only .NET operations tool into an Angular web platform, expanding access from a handful of on-site staff to **~70** users, then built 6 new modules from scratch.
- Owned end-to-end delivery and client communication for a 4-engineer pod, shortening deployment cycles by **44%** with CI/CD pipelines and raising test coverage by 54% with Karma/Jasmine suites.

Technical Skills

Languages	**Python**, JavaScript (ES6+), SQL
Backend & System Design	**FastAPI**, Node.js, Celery, REST APIs, Event-Driven and Microservices Architecture
Data & Messaging	Redis, **MongoDB**, MySQL, RabbitMQ, Amazon SQS
Cloud & Infrastructure	**AWS** (Lambda, Fargate, ECS, S3, CloudFormation), Docker, GitLab CI/CD
Observability, Security & Testing	Prometheus, Grafana, AWS CloudWatch, Pytest, Playwright, Selenium, SAST, VAPT

Projects

Distributed Quota-Metering Engine *FastAPI, Redis Lua, MongoDB, Docker Compose* github.com/Arihant416/quota-meter

- Engineered a per-organization quota service where one Redis Lua script atomically handles validation, idempotency, deduction, and denial logging, with all-or-nothing batches, idempotent refunds, and monthly resets without scheduled jobs.
- Tested 10,000 concurrent requests with **zero over-serving**; retries with the same idempotency key used quota once.

Education

Swami Keshvanand Institute of Technology *B.Tech, Information Technology* Aug 2017 – Jun 2021
